

## ORCHESTRATION AND CONTROL CHALLENGES IN NGSO NETWORKS

ASHESH MISHRA | ashesh@aalyria.com

#### STATIC NETWORK / DYNAMIC SERVICES

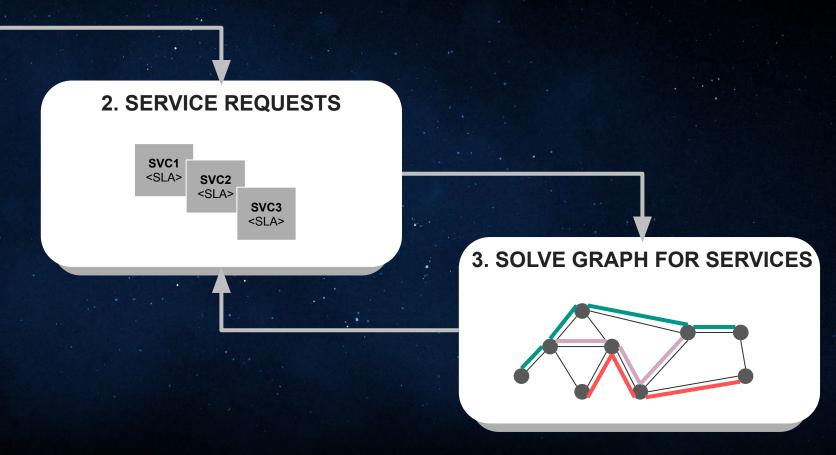

#### CHALLENGES IN TIME-/SPACE-DYNAMIC NETWORKS

Availability and location of nodes changes with time;

Availability and capacity of links/edges changes with time, environment, regulations, etc.

#### DYNAMIC NETWORKS

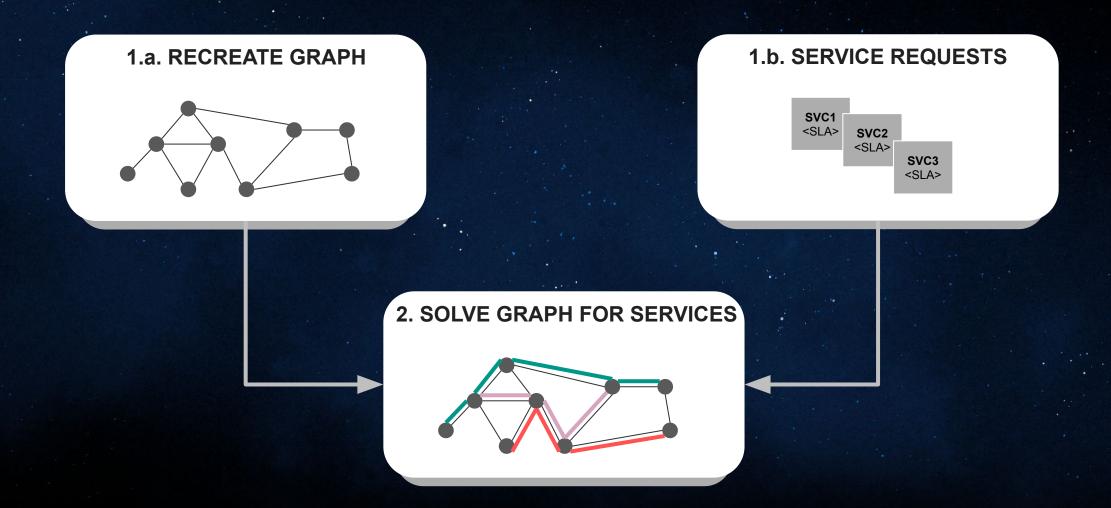

#### NATURE OF NGSO NETWORKS

Time-Dynamic: Varying availability based on time-of-day (especially in EO/SAR)

Space-Dynamic: Relative motion and link-performance every millisecond

Dynamic-Intent: Varying needs and M2M interface interactions (for instance, disaster response)

### TEMPOROSPATIAL SDN

### SPACETIME

A temporospatial SDN platform for all-domain mesh orchestration

Emulate

Start by modeling your current or planned network on a private, hosted and managed instance of Spacetime. Emulate your current or next-generation network and showcase Spactime's ability to optimize your business or mission outcomes.

Optimize

Add real hardware to the Spacetime environment as prototypes and final systems become available to incrementally grow into a production-ready instance.

Orchestrate

Orchestrate your network with Spacetime hosted on your preferred infrastructure provider and classification level, and provides 24x7x365 carrier-grade support to keep your network operational at the highest level of reliability. Continue to future proof your network with continuous feature updates.

Coordinate

When you're ready, to coordinate resource sharing and interconnections with partners and allied networks – on your terms.
